

Shield®

# Shield® INSTALLATION

## Where should I put the appliance in a room?

The Shield will clean the entire volume of air during its purification cycle. The obstructions in, movement of people around and general configuration of your room may hinder the optimal mixing of the air. We therefore recommend selecting a central position in the room.

Before use, check that the appliance's air inlet and outlet gratings are clear, and the gratings are not facing any furniture or other obstacle. The appliance's air inlets and outlets must be kept clear.

The Shield's performance will be impaired if placed against a wall or at one end of the room. Select a larger volume if you want to increase its performance.

## Which way round should I put the appliance to purify one part of the room more than another?

You should point the appliance towards pollution and contamination sources to create a loop effect.

## My room is bigger than 60m<sup>2</sup>

We recommend adding a second appliance and distributing them along the room's axis of symmetry. If obstructions do not allow this, we recommend placing them according to the identified pollution and contamination hazards.
